Date.
Page No.

- Eg:- x=20; → Update value or status.

iv) Deletion:-
- Remove identifiers when scope ends.
- Eg:- {

```
{
      int x;
   } → x deleted after block.
```

v) Scope Management:-
- Enter new scope → create new table.
- Exit scope → remove table.

2.) a) Linear List (Array/Linked List):-
- Elements stored sequentially.
- Search is done linearly.

Time Complexity:-
- Search → O(n).
- Insert → O(1) (at beginning).
- Delete → O(n)

Advantages:-
- Simple to implement.
- Good for small programs.

Disadvantages:-
- Very slow for large data.
- Inefficient searching.

b) Hash Table:-
- Uses hash function to map identifier → index.
- Handles collisions using chaining or probing.

Time Complexity:-
- Search → O(1) (average)
- Insert → O(1)
- Delete → O(1)
