

6	$b = a + 1$	$\{d4\}$	$\{d2\}$
7	$c = b + a$	ϕ	ϕ

Data Flow Equations:-

For each statement:-

$$OUT[n] = GEN[n] \cup (IN[n] - KILL[n])$$

$$IN[n] = \cup OUT[predecessor]$$

Line	IN	OUT
1	ϕ	$\{d1\}$
2	$\{d1\}$	$\{d1, d2\}$
3	$\{d1, d2\}$	$\{d1, d2\}$
4	$\{d1, d2\}$	$\{d2, d3\}$
5	$\{d2, d3\}$	$\{d2, d3\}$
6	$\{d1, d2\}$	$\{d1, d4\}$
7	$\{d1, d2, d3, d4\}$	$\{d1, d2, d3, d4\}$

• At line 7:-

- All definitions reach $\rightarrow \{d1, d2, d3, d4\}$
- Means multiple possible values of a and b may reach.
