

Given Identifiers:-

x, count, sum, temp, value, index.

Compute Hash Values:-

Identifier	Length	Hash Value
x	1	1
count	5	5
sum	3	3
temp	4	4
value	5	5
index	5	5

Hash Table (Size = 10)

0	-
1	x
2	-
3	sum
4	temp
5	count → value → index
6	-
7	-
8	-
9	-

- count, value, index all hash to index 5.
- This causes collision.
- Using chaining, we store them as a linked list at that index.

4.) Scope defines the region of a program where a variable is accessible. It is of two types:- global
