

Return Address
Control Link
Access Link (Optional)
Parameters
Local Variables
Temporary Variables

- i) Return Address:-
 - Stores where to return after function completes.
- ii) Control Link (Dynamic Link):-
 - Points to caller's activation record.
 - Helps in stack unwinding.
- iii) Access Link (Static Link):-
 - Used for nested functions.
 - Points to outer scope.
- iv) Parameters:-
 - Stores function arguments.
- v) Local Variables:-
 - Variables declared inside function.
- vi) Temporary Variables:-
 - Used for intermediate computations.
- 7) Block-structured languages (like C, C++, Java) allow nested blocks, where each block has its own local variables and scope.
